OLED displays are composed of several layers, including TFT elements, organic materials, encapsulation layers, and cover windows. Among these, an OLED mask tensioner is used to tension and secure the mask to the frame to deposit and form the emitting layer (EML, Emitting Layer) and the remaining layers (HIL, HTL) made of RGB organic materials.

As OLED devices are used in a range of end-use scenarios. The increased use of smartphones and the soaring demand for better cellphones are driving the industry's expansion. Smartphones and tablets are using active-matrix OLED (AMOLED) screens more frequently because of their great activation speed. Additionally, they use far less power than LCD, which is why they are recommended for widespread usage in smartphones. The popularity of different wearable gadgets like smartwatches and fitness bands is also boosting the industry's expansion. Increased demand for automated and bright-screen displays is fueling the market's expansion.
