Abstracts

OLEDs are organic materials-based diodes capable of producing light without needing a source of light for projection.

SCOPE OF THE REPORT:

This report focuses on the OLED Material in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

OLEDs are used for two broad applications, namely lighting and displays, which work with the same principle. An OLED panel consists of organic material packed between conductor films, which produce light when electricity is passed through the films. LCD display is a prime substitute for OLEDs in displays. LCD display needs a backlight and filters to emit light, whereas OLED displays does not need these components. Also, OLED lightings are expected to be more power efficient than LEDs. OLED materials can be classified as small-molecule-based light emitting diode and polymer light emitting diodes.

The worldwide market for OLED Material is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
