Abstracts

According to our (Global Info Research) latest study, the global Oleyl Amine market size was valued at US\$ 171 million in 2025 and is forecast to a readjusted size of US\$ 232 million by 2032 with a CAGR of 4.4% during review period.

Oleyl amine refer to a class of long-chain primary amine compounds obtained from fats and oils through hydrolysis to generate fatty acids, and then through ammonification and hydrogenation reduction processes. The carbon chain distribution is usually in the range of C8-C18, with C16-C18 being the main component. Its molecular structure combines hydrophobic hydrocarbon chains and hydrophilic amino groups, with good surface activity, adsorption, and reactivity. Therefore, it is widely used in mineral flotation agents, oilfield chemical additives, agricultural additives, corrosion inhibitors, and surfactant intermediates. It is a basic functional intermediate in the oil and fat chemistry industry chain. In 2025, global Oleyl Amine production reached approximately 54.26 K MT, with an average global market price of around US\$ 3,065 per MT. The annual production capacity of oleyl amine is 120 K MT, with a gross profit margin of about 20%.

The upstream mainly consists of oil suppliers, as well as intermediate chemical enterprises such as fatty acids and fatty nitriles; Downstream industries mainly focus on mineral flotation (non-ferrous metal beneficiation), oilfield chemistry (drilling and oil recovery additives), agricultural additives, industrial surfactants, and corrosion inhibitors, with demand highly correlated with the prosperity of the resource industry.

In terms of cost structure, raw material costs account for approximately 55% -75%; The production and manufacturing costs account for about 15% -25%; Separation, purification, and quality control account for approximately 5% -10%; Packaging,

transportation, and loss account for approximately 3% -8%.

Oleyl amine belongs to mature bulk fine chemical subdivision products, with a large overall demand scale but relatively stable growth, mainly driven by agriculture, mining, and energy industries, showing obvious cyclical characteristics. The upstream of the industry is highly dependent on the price fluctuations of fats (palm oil, beef fat), while the midstream is concentrated in a few chemical enterprises with amination and hydrogenation capabilities. The downstream applications are scattered but mainly in the industrial sector. The core of competition lies in the ability to integrate raw materials and the advantage of scale and cost. In the region, Southeast Asia and China dominate in terms of production capacity and cost, while European and American enterprises still have technological and brand advantages in the field of high-end functional fatty amines and derivatives.
