Abstracts

The global Oligo Synthesis market size is expected to reach \$ 1671 million by 2032, rising at a market growth of 11.3% CAGR during the forecast period (2026-2032).

Oligo synthesis, also known as oligonucleotide synthesis, is a laboratory technique used to chemically synthesize short sequences of nucleic acids, typically DNA or RNA oligonucleotides. These oligonucleotides are composed of relatively short chains of nucleotides, usually less than 100 bases in length. Oligos (or oligonucleotides) are commonly used as primers in PCR (polymerase chain reactions) to selectively amplify target DNA sequences. They can be tagged with fluorescent dyes or radioisotopes for detection purposes. Oligos are often used in DNA sequencing, gene synthesis, and genetic testing, and can be modified for gene therapies or gene expression.

Global key players of Oligo Synthesis include Thermo Fisher Scientific, Merck, Genscript, BBI Life Sciences, Integrated DNA Technologies (IDT), etc. The top five players hold a share about 44%. North America is the largest market, and has a share about 53%, followed by Asia-Pacific and Europe with share 25% and 15%, separately. In terms of product type, Common Primer Synthesis is the largest segment, occupied for a share of 64%. In terms of end user, Biotech Company has a share about 75 percent.
