Abstracts

The global Oligonucleotide Drug Delivery market size is expected to reach \$ 84010 million by 2029, rising at a market growth of 3.6% CAGR during the forecast period (2023-2029).

The Oligonucleotide Drug Delivery Market is driven by the rapid advancement in oligonucleotide-based therapies, including antisense, siRNA, and aptamer-based drugs, which hold immense potential for treating various genetic and rare diseases. These therapies rely on oligonucleotides to modulate gene expression, inhibit specific targets, or diagnose genetic disorders. As the understanding of genetic mechanisms and precision medicine continues to evolve, the demand for efficient and targeted delivery systems for oligonucleotide drugs grows. Innovations in drug delivery technologies, such as lipid nanoparticles and conjugates, as well as the expansion of oligonucleotide drug pipelines, further contribute to market expansion. However, a significant challenge for this market is the need to address the complexity of drug delivery, including overcoming biological barriers, minimizing off-target effects, and ensuring long-term safety and efficacy. Overcoming delivery hurdles, optimizing pharmacokinetics, and navigating regulatory pathways are ongoing challenges. Additionally, the market faces competition from traditional drug therapies, and the need for continuous research and development to enhance the delivery efficiency and patient acceptance of oligonucleotide drugs. Striking a balance between providing efficient and precise oligonucleotide drug delivery solutions while addressing safety and regulatory considerations is crucial for the continued growth of the Oligonucleotide Drug Delivery Market.

Oligonucleotides can be used to modulate gene expression via a range of processes including RNAi, target degradation by RNase H-mediated cleavage, splicing modulation,

non-coding RNA inhibition, gene activation and programmed gene editing.
