## Abstracts

An Omni wheel is a wheel that can move in any direction. It consists of a main rotating part on the body and a passive rotating part of rollers placed on the outer circle of the body. Usually, a set of three wheels or a set of four wheels is used. Compared to a wheel configuration with tires using a steering wheel, such as in an automobile, the moving mechanism is simpler, making it suitable for smaller sizes and lighter weight.

Omni wheels are mainly used as moving mechanisms for robots and carts. Because they are suitable for moving in confined spaces, they are often used as an unmanned transport robot in factories and warehouses, or as a wheelchair for indoor environments such as hospitals.

Omni wheels as an unmanned transport robot also include a robot with a human tracking function equipped with sensors. Since the Omni wheels can move with work equipment on them, they can be used as both a dolly and a work platform.

According to our (Global Info Research) latest study, the global Omni Wheel market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
