Oncolytic virus therapy for melanoma is an innovative cancer treatment approach. Oncolytic viruses are either genetically engineered or naturally - occurring viruses that can selectively target and replicate within melanoma cells while minimizing damage to normal cells. These viruses have the ability to preferentially infect tumor cells because melanoma cells possess unique biological characteristics. For example, they have active cell - proliferation signaling pathways, defective antiviral immune responses, and certain specific cell - surface receptors. These features enable oncolytic viruses to more easily enter and replicate within melanoma cells.
