Abstracts

According to our (Global Info Research) latest study, the global One-Way Spot Expander market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

A unidirectional spot expander is an optical component used to expand a unidirectional spot into a multi-directional spot. It usually consists of a lens and a prism. The lens is used to focus the light, and the prism is used to disperse the light, so that the spot can be expanded into multiple directions. The working principle of the one-way spot expander is to focus the one-way light into one point through the lens, and then spread the point into multiple directions through the prism. Due to the different refraction angles of the prisms, the light rays in different directions will have different deflection angles, thereby realizing the expansion of the light spot. By adjusting the parameters of the lens and prism, the expansion degree and direction of the light spot can be controlled. Unidirectional spot expanders are widely used in laser processing, optical measurement, optical communication and other fields. It can expand the unidirectional laser spot into multiple directions, so that the laser can cover a larger area, thereby improving processing efficiency and measurement accuracy. At the same time, the unidirectional spot expander can also be used in optical communication systems to expand unidirectional optical signals into multiple directions, improving the reliability and stability of signal transmission.
