Abstracts

Transformer-based UPS systems are the most common power supply technology for 100 kVA and above, with the option to achieve large kW sizes or provide redundancy. The machine has an isolated DC function to ensure the load's safety. This transformer effectively isolates the DC component of the inverter output from the load, improving load protection, especially for switches and inductive loads. Compared to transformerless UPS, transformer-based UPS have the advantages of stability, reliability, high overload capacity, and impact resistance. Furthermore, the transformer-based design allows the UPS to be installed in harsher operating environments than transformerless units.

According to our (Global Info Research) latest study, the global Online Transformer-Based UPS market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
