## Abstracts

According to our (Global Info Research) latest study, the global Onshore Structure Corrosion Control Service market size was valued at US\$ 33908 million in 2025 and is forecast to a readjusted size of US\$ 49375 million by 2032 with a CAGR of 5.5% during review period.

Onshore Structure Corrosion Control Services encompass a range of professional technical solutions—including inspection, risk assessment, protection design, surface treatment, anti-corrosion coating, cathodic protection, material repair, and long-term monitoring—tailored for steel and concrete structures, pipelines, storage tanks, equipment supports, and other infrastructure in onshore environments. The core objective is to mitigate the impact of metal rusting, rebar corrosion in concrete, chemical attack, and environmental degradation on structural integrity, containment, and service life, thereby preventing leaks, loss of load-bearing capacity, and unplanned downtime. Key clients include onshore oil and gas fields, long-distance pipelines, refineries and petrochemical plants, tank farms, chemical processing units, power facilities, mining equipment, bridges, port facilities, and industrial plants. Unlike simple anti-corrosion coating application, these services typically cover the entire lifecycle: inspection and assessment, solution design, project implementation, quality acceptance, operational monitoring, and maintenance and repair.

The gradual aging of onshore oil and gas, chemical, power, transportation, and municipal infrastructure serves as the primary driver for the growth of onshore structural corrosion control services. Steel structures, storage tanks, pipelines, bridges, and concrete facilities—exposed over long periods to rain, heat and humidity, salt spray, industrial pollutants, soil electrolytes, and chemical media—are prone to coating

degradation, wall thinning, rebar corrosion, and localized perforation. Rather than opting for complete asset replacement, operators prefer extending service life through inspection, recoating, cathodic protection, localized repair, and structural reinforcement, thereby mitigating risks associated with leaks, production shutdowns, and safety incidents. Research by the U.S. Federal Highway Administration indicates that cathodic protection can inhibit rebar corrosion in chloride-contaminated concrete, offering a repair alternative to total replacement for damaged bridges.

Asset integrity regulations, environmental safety requirements, and the corporate need to minimize unplanned downtime are driving a shift in corrosion control from reactive repair to risk-based prevention. Corrosion-induced failure of oil and gas pipelines, storage tanks, refining units, and pressure equipment can lead to leaks, fires, environmental pollution, and significant production losses; consequently, clients are intensifying efforts in risk-based inspection, residual life assessment, corrosion loop management, and online monitoring of critical areas. DNV notes that external corrosion—particularly corrosion under insulation (CUI), corrosion at support contact points, and corrosion in areas difficult to inspect visually—poses a widespread threat to process industry equipment, necessitating more systematic analysis and prediction. Future corrosion control projects will increasingly be implemented in coordination with asset integrity management, maintenance prioritization, and full-lifecycle budgeting.

The industry's technological trajectory is shifting toward digital monitoring, robotic inspection, and condition-driven maintenance. While traditional services relied heavily on manual patrols, periodic thickness measurements, and scheduled recoating, the future will see greater use of fixed corrosion sensors, drones, wall-climbing robots, 3D scanning, intelligent pigging, and AI-based image recognition to continuously or frequently assess coating damage, corrosion rates, and structural deformation. Inspection data will be integrated into digital twins and asset management platforms, enabling operators to predict degradation trends and schedule repairs before risks reach critical thresholds. DNV's pipeline integrity and condition monitoring solutions already utilize data on corrosion, material defects, and external threats for proactive risk management, reflecting the industry's transition from fixed-interval maintenance to predictive and condition-based maintenance.
