Abstracts

The ?P monitoring reset chip is a semiconductor integrated circuit that monitors and detects the working status of the microprocessor (?P) and controls its stop and start. Also known as a supervisor or regulator. If the power supply falls below the minimum operating voltage, operation of the microprocessor is no longer guaranteed. Additionally, loss of control may occur due to programming or other factors. The function of this IC is to monitor the microprocessor's supply voltage and runaway conditions and initialize or stop it appropriately.
