An Open AC Reactor, also known as an open-type AC reactor, is a type of electrical component used in AC circuits. It typically consists of a coil wound around a magnetic core. The coil is usually made of copper wire, which has good electrical conductivity. The magnetic core is often made of laminated steel sheets to reduce eddy current losses. It has an open design, which means it does not have a fully enclosed housing like some other types of reactors. This open construction allows for better heat dissipation compared to enclosed reactors.
