Abstracts

The open plunger pump is a common positive displacement pump, and its working principle is based on the reciprocating motion of the plunger inside the pump body. This pump design includes one or more plungers that are connected to a cylinder inside the pump body. When the plunger advances forward under the action of the driving mechanism, the liquid in the pump body is squeezed out; and when the plunger contracts backward, the liquid is sucked into the pump body. This motion cycle creates a continuous flow of liquid, allowing the open plunger pump to provide stable flow and pressure. Open plunger pumps are commonly used in applications requiring high-pressure, high-precision liquid transfer, such as high-pressure cleaning, chemical processing, lubrication systems, injection equipment, etc. Their design is simple, easy to maintain, and allows efficient flow regulation and pressure control. Therefore, it is widely used in many industrial fields.

According to our (Global Info Research) latest study, the global Open Plunger Pump market size was valued at US\$ 2627 million in 2023 and is forecast to a readjusted size of USD 3507 million by 2030 with a CAGR of 4.2% during review period.

The open plunger pump market shows a growing trend year by year and maintains a stable development trend.
