The global Ophthalmic Laser Photocoagulation Machine market size is expected to reach \$ 1197.2 million by 2029, rising at a market growth of 4.0% CAGR during the forecast period (2023-2029).

The ophthalmic laser photocoagulation machine is a medical device specially used for the treatment and surgery of eye diseases. It uses laser technology to accurately irradiate eye tissue and achieve relief or radical cure of eye diseases through local photocoagulation and treatment. These devices can be used to treat a variety of eye conditions, including retinal diseases, vitreous diseases, corneal problems, and some conditions such as glaucoma. Ophthalmic laser photocoagulation machines usually have high-precision laser emission systems, real-time imaging technology, safety control functions, and user-friendly interfaces. The doctor can adjust the laser parameters and implement the treatment according to the patient's specific condition, thereby reducing the patient's discomfort and risk of complications. Different types of laser photocoagulation machines can be suitable for different eye diseases based on their laser sources and treatment modes. With the continuous advancement of medical technology and changes in ophthalmic medical needs, ophthalmic laser photocoagulation machines are also constantly developing. Advances in laser technology may make minimally invasive treatments possible, reducing surgical trauma and postoperative recovery time.
