Abstracts

Ophthalmic ultrasound probes are ultrasound probes dedicated to eye examinations. An ultrasonic probe is a device that transmits and receives ultrasonic waves during ultrasonic testing. The performance of the probe directly affects the characteristics of the ultrasonic wave and affects the detection performance of the ultrasonic wave.

The probe used in ultrasonic testing is a transducer that uses the piezoelectric effect of materials to convert electrical energy and sound energy. The key component in the probe is the wafer, which is a single crystal or polycrystalline sheet with piezoelectric effect, and its function is to convert electrical energy and acoustic energy into each other.

This report studies the global Ophthalmic Ultrasound Probe production, demand, key manufacturers, and key regions.
