According to our (Global Info Research) latest study, the global Ophthalmology AI Screening Software market size was valued at US\$ 2091 million in 2025 and is forecast to a readjusted size of US\$ 11284 million by 2032 with a CAGR of 27.5% during review period.

Ophthalmic AI screening software is an artificial intelligence software used in the field of ophthalmic disease screening. It is based on deep learning algorithms and realizes automatic screening, auxiliary diagnosis and condition assessment of ophthalmic diseases by analyzing ophthalmic related data such as fundus images.

The prospects for ophthalmic AI screening software are broad, and it is currently at a critical stage of evolution from 'single-disease-assisted detection' to 'comprehensive multi-disease assessment and systemic health early warning.' The market growth drivers are clear: the increase in the global diabetic patient population and the aging population has driven up the rigid demand for early eye disease screening; continuous progress in deep learning technology has improved the accuracy and reliability of algorithms; at the same time, supportive regulatory policies and exploration of medical insurance payment are accelerating its clinical implementation. In the future, this field will exhibit three major trends: First, technological integration, which will be combined with portable devices and telemedicine platforms to expand screening scenarios from hospitals to grassroots communities and even homes; second, functional diversification, extending from single eye disease screening to predicting disease progression and assessing overall health; and third, ecosystem systematization, integrating into the closed loop of 'prevention-screening-diagnosis-management' and becoming an important digital infrastructure for eye health and even chronic disease management

systems.
