According to our (Global Info Research) latest study, the global Optical Achromatic Lens market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The optical achromatic lens is an optical lens designed to reduce or eliminate chromatic aberration. Chromatic aberration is caused by changes in the refractive index when light of different wavelengths passes through the lens.

Optical achromatic lenses usually consist of two or more lens elements with different refractive indices. The refractive index, curvature, and thickness of these lens elements are precisely designed to allow compensatory dispersion of light of different wavelengths in the lens, thereby reducing or eliminating chromatic aberration. Optical achromatic lenses feature reduced chromatic aberration, broadband compensation, high-resolution imaging, and multiple design options.
