Abstracts

The global Optical Axis Aligner market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Optical axis calibrator is an instrument used to adjust the position of the optical axis of optical equipment. The optical axis refers to the ideal propagation direction of light when passing through an optical system. For many optical devices (such as telescopes, microscopes, cameras, etc.), the accurate position of the optical axis is very important. Optical axis aligners usually consist of a light source and a set of optical components. The light emitted by the light source is processed by optical elements to form a beam of light parallel to the optical axis. By adjusting the position and angle of the optical element, the light can be aligned with the optical axis when passing through the calibrated optical device. During the optical axis calibration process, you can use some auxiliary tools, such as telescopes, optical platforms, optical rulers, etc., to help determine the position of the optical axis. The goal of calibration is to focus light accurately at the desired location, thereby improving the imaging quality and performance of optical equipment.
