The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Optical Diaphragm is a device used in optics and photonics to control the amount of light that passes through an optical system. It consists of a thin, circular or rectangular sheet of material with a small aperture in the center that can be adjusted to change the size of the opening. The size of the aperture can be controlled by a variety of mechanisms, including mechanical, electrical, or magnetic.

The upstream industry chain of Optical Diaphragm includes the production of raw materials such as glass, plastics, and metals, as well as the manufacturing of precision components such as lenses, mirrors, and filters. The downstream industry chain includes industries such as scientific research, medical equipment, imaging equipment, and telecommunications.
