Abstracts

The global Optical Fiber Tapered Coupler market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Fiber tapered coupler is an optical device used to couple optical signals from one optical fiber to another optical fiber. It is usually made from a length of optical fiber through a tapering process, so that its diameter gradually becomes smaller, thereby achieving coupling of optical signals. The working principle of the optical fiber tapered coupler is that during the process of optical fiber tapering, the mode field of the optical signal gradually diffuses, thereby achieving coupling of the optical signal. When the optical signal enters the tapered area from the thick end, as the fiber diameter becomes thinner, the mode field of the optical signal gradually diffuses, causing the energy of the optical signal to be gradually transmitted to the surrounding space. When the optical signal is transmitted to the thin end of the tapered end, because the fiber diameter becomes very small, the mode field of the optical signal has diffused into the space and can be coupled with another optical fiber. Optical fiber tapered couplers have high coupling efficiency and low insertion loss, which can achieve efficient optical signal transmission and coupling. It is widely used in fiber optic communication systems, fiber optic sensing systems, fiber lasers, fiber amplifiers and other fields. It is especially suitable for application scenarios that require efficient coupling between optical fibers and optical signal transmission.
