According to our (Global Info Research) latest study, the global Optical Fingerprint Recognition Technology market size was valued at US\$ 1707 million in 2023 and is forecast to a readjusted size of USD 2328 million by 2030 with a CAGR of 4.4% during review period.

Optical fingerprint recognition technology is a biometric method that captures the user's fingerprint image through an optical sensor. It is widely used in smartphones, tablets and other security devices. This technology uses the principle of light reflection. When the finger is pressed on the sensor, the light source (such as LED or OLED pixels of the screen itself) illuminates the fingerprint surface, and the ridge and valley structure of the fingerprint reflects light in different ways. These reflected lights are captured by the high-resolution image sensor below and converted into digital signals. After being analyzed by the image processing algorithm, a unique fingerprint template is generated for identity authentication.
