Optical frequency domain reflectometry (OFDR) is a specialised technology for analysing optical light paths and reflection characteristics in optical fibres and components. Unlike OTDR, OFDR operates in the frequency domain with continuous wave (CW) light sources, allowing for higher signal-to-noise ratios. A tuneable laser source sweeps over a specific wavelength band in a typical OFDR system (e.g. 1535nm-1565nm). The light is then transmitted through a fibre and interfered with by a reference arm. The spatial distribution of the reflected light is calculated using the Fourier transformation of the resulting signal.

This report studies the global Optical Frequency Domain Reflectometry production, demand, key manufacturers, and key regions.
