According to our (Global Info Research) latest study, the global Optical Limiting Amplifier market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

An Optical Limiting Amplifier (OLA) is a type of optical amplifier that is designed to limit or suppress the amplitude of an optical signal. It operates by amplifying the signal up to a certain threshold and then controlling or reducing the gain beyond that threshold, effectively limiting the output power of the signal. The main purpose of an OLA is to protect optical receivers or other downstream components from excessively high optical power levels. When an optical signal exceeds a certain power level, it can cause damage to sensitive components, lead to signal distortion, or introduce errors in data transmission.
