Abstracts

According to our (Global Info Research) latest study, the global Optical Passive Device market size was valued at US\$ 9171 million in 2024 and is forecast to a readjusted size of USD 19940 million by 2031 with a CAGR of 11.8% during review period.

Optical passive devices refer to devices that consume a certain amount of optical energy and have certain functions without photoelectric or electro-optical conversion in optical communication systems, including optical fiber connectors, optical fiber couplers, optical wavelength division multiplexers, optical attenuators, and optical isolators, etc.

The global trend towards the switch to passive optical networks (PONs) is also related to the expansion of broadband access networks and at the same time to the growth in bandwidth hunger. Due to its broadband capabilities, low operational costs and high-speed Internet services in urban, suburban and rural areas, PON has gained popularity. In developing countries, various companies and governments are focusing on promoting digital infrastructure. Thus, the global trend to mass video transmission, cloud services and IoT applications, GPON and NG-PON technologies are increasingly being widespread. The proliferation of 5G networks and the explosion of IoT devices have propelled the demand for a novel and advanced optical network. 5G network back and front infrastructure relies on passive optical components to minimize signal delays and enable buffer-free transmissions. The use of these components in IoT networks enables the processing and communication of information in real-time, which is important for autonomous vehicles, smart grids, and industrial automation.
