Optical touch screens are a type of touch-sensitive display technology that uses infrared light and optical sensors to detect touch input. Instead of relying on pressure or capacitive changes, optical touch screens work by placing infrared LEDs and photodetectors around the edges of the screen to create an invisible grid of light beams. When a finger or object interrupts these beams, the sensors detect the touch location based on which beams are blocked. Known for their high durability, multi-touch capability, and resistance to wear, optical touch screens are often used in interactive kiosks, large-format displays, and industrial applications.
