According to our (Global Info Research) latest study, the global Optical Viewing Angle Tester market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

An optical viewing angle tester is an instrument used to measure and evaluate the viewing angle characteristics of optical devices or displays. It can measure parameters such as viewing angle range, viewing angle dependence, color change, and brightness change of a device. Optical viewing angle testers usually use imaging principles to evaluate the viewing angle characteristics of optical devices by observing and recording images or light intensity distributions at specific viewing angles. It can provide information about the image quality, contrast, color accuracy, etc. of the device under different viewing angles. Optical viewing angle detectors are widely used in the R&D, manufacturing and quality control processes of various optical devices and displays. For example, in fields such as liquid crystal displays (LCDs), organic light-emitting diode displays (OLEDs), projectors, and display modules, optical viewing angle testers can help evaluate the display effect and performance of devices under different viewing angles. Through the optical viewing angle tester, quantitative data on parameters such as the viewing angle range, viewing angle dependence, color change, and brightness change of the device can be obtained, thereby helping to optimize the device design and manufacturing process and improve product quality and performance.
