Abstracts

Optically pumped magnetometers (OPMs) are high-sensitivity quantum sensors that take advantage of the unique alkali vapor properties and their interaction with external magnetic and laser fields to detect magnetic fields with unpresentable sensitivity. When compared to superconducting sensors, OPMS have strengths and weaknesses. However, they surpass the sensitivity of superconducting sensors, while also working without cryogenics, making them potentially disruptive in the biomagnetic applications of magnetoencephalography (MEG) and magneto-cardiography (MCG).

According to our (Global Info Research) latest study, the global Optically Pumped Magnetometers (OPM) Modules market size was valued at US$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
