Oral anorexiant drugs are medications designed to suppress appetite and reduce food intake, aiding in weight loss for individuals who are overweight or obese. These drugs typically act on the central nervous system, either by stimulating the release of certain neurotransmitters like norepinephrine and dopamine, which can create a feeling of fullness, or by blocking the reuptake of these chemicals, prolonging their appetite-suppressing effects. Commonly prescribed oral anorexiant include phentermine, diethylpropion, and lorcaserin. They are often used in conjunction with lifestyle modifications such as diet and exercise to enhance weight loss results. However, these medications can have side effects such as increased heart rate, elevated blood pressure, insomnia, and potential for abuse or dependency, and they are usually recommended for short-term use under medical supervision.
