Oral bone regeneration materials are biomedical materials used in oral and maxillofacial surgery to repair bone defects or induce bone regeneration. They are commonly applied in procedures such as alveolar ridge augmentation, socket preservation, periodontal bone defect treatment, and guided bone regeneration (GBR). These materials may be derived from autogenous (patient's own bone), allogenic, xenogenic, or synthetic sources, and come in various forms such as granules, powders, blocks, or injectable pastes. Their primary role is to serve as scaffolds or osteoinductive/osteoconductive agents to support new bone formation and restore anatomical structure.
