Oral CDK4/6 inhibitors are a class of targeted cancer therapies designed to interfere with the activity of cyclin-dependent kinases 4 and 6 (CDK4/6), which play a crucial role in regulating the cell cycle. By inhibiting these kinases, these drugs help to halt the proliferation of cancer cells, particularly in hormone receptor-positive breast cancers.

The development of oral CDK4/6 inhibitors has progressed rapidly, initially focusing on their success in hormone receptor-positive breast cancer and expanding to explore combinations with other therapies to enhance efficacy and overcome resistance. Ongoing research emphasizes personalized medicine, aiming to identify biomarkers that help tailor treatments to individual patients. As new compounds and dosing strategies emerge, the scope of these inhibitors is likely to broaden into additional cancer types, supported by advancements in technology that facilitate better patient selection and treatment optimization.
