According to our (Global Info Research) latest study, the global Orbital Angular Momentum Fiber market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Orbital angular momentum fiber is a few-mode fiber that uses the orbital angular momentum of photons to achieve mode division multiplexing. The orbital angular momentum of a photon describes the characteristic of the photon rotating around the propagation axis, making the phase wavefront of the light spiral. Different orbital angular momentum modes are orthogonal to each other, allowing multiple signals to be transmitted simultaneously at the same frequency, thereby increasing the information capacity of optical fiber communications. There are two types of orbital angular momentum fibers: quantum and statistical. Quantum state orbital angular momentum optical fiber is generated by cyclotron oscillation electron radiation, which can provide a new dimension of physical transmission and is theoretically expected to break through the traditional MIMO capacity limit. Statistical orbital angular momentum fiber is generated by a special antenna or antenna array, which is essentially beam forming. In theory, it does not break through the MIMO capacity boundary, but it can reduce system complexity.
