Abstracts

The ore sorting system is a technology and equipment system used to separate useful components from useless components in ores. Its main purpose is to improve the grade of ore, increase the recovery rate of useful components, reduce production costs, and reduce environmental pollution.

According to our (Global Info Research) latest study, the global Ore Sorting System market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.

With the development of artificial intelligence, machine learning and other technologies, ore sorting systems may achieve more intelligent and automated operations. For example, by introducing intelligent sensors, control systems and data analysis technology, real-time monitoring and analysis of ore composition, structure, grade and other information can be achieved, thereby optimizing mineral processing parameters and operating strategies, and improving sorting efficiency and recovery rate.
