Abstracts

Organ transplantation is a medical procedure in which an organ is removed from one body and placed in the body of a recipient, to replace a damaged or missing organ. The donor and recipient may be at the same location, or organs may be transported from a donor site to another location. Organs and/or tissues that are transplanted within the same person's body are called autografts. Transplants that are recently performed between two subjects of the same species are called allografts. Allografts can either be from a living or cadaveric source.

SCOPE OF THE REPORT:

This report studies the Organ Transplantation market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Organ Transplantation market by product type and applications/end industries.

Organs that have been successfully transplanted include the heart, kidneys, brain, liver, lungs, pancreas, intestine, and thymus. From year 2000 and forward, there has been approximately 2,200 lung transplants performed each year worldwide. From between 2000 and 2006, the median survival period for lung transplant patients has been 5-and-a-half years, meaning half the patients survived for a shorter time period and half survived for a longer period. In China, a kidney transplant operation runs for around \$70,000, liver for \$160,000, and heart for \$120,000. Although these prices are still unattainable to the poor, compared to the fees of the United States, where a kidney transplant may demand \$100,000, a liver \$250,000, and a heart \$860,000, Chinese prices have made China a major provider of organs and transplantation surgeries to other countries. In India, a kidney transplant operation runs for around as low as \$5000.

The global Organ Transplantation market is valued at xx million USD in 2017 and is expected to reach xx million USD by the end of 2023, growing at a CAGR of xx% between 2017 and 2023.
