The global Organic Solvent Dehydration Membrane market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Organic Solvent Dehydration Membrane is a membrane technology used to remove water from organic solvents. This kind of membrane is usually used in fields such as fine chemicals, pharmaceuticals and electronics, where moisture in organic solvents needs to be treated to ensure product quality and production efficiency, such as solvent exchange, catalyst recovery, organic matter recovery and product purification.

Organic Solvent Dehydration Membrane usually uses highly selective membrane materials that allow water molecules to pass through while leaving organic solvents on the other side. This technology uses the principle of pervaporation to effectively separate and remove water molecules in organic solvents, thereby achieving dehydration of organic solvents.

This report studies the global Organic Solvent Dehydration Membrane production, demand, key manufacturers, and key regions.
