## Abstracts

According to our (Global Info Research) latest study, the global Organoid Cryopreservation Medium market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Organoid cryopreservation medium refers to a specialized solution used in the preservation of organoids, which are three-dimensional structures that mimic the architecture and function of organs. Cryopreservation is a process that involves freezing biological samples to extremely low temperatures to halt metabolic activity and preserve cellular structures. Organoids, often derived from stem cells, are used in research and medical applications. The cryopreservation medium is formulated to protect organoids during freezing and thawing processes, preventing damage to cells and preserving their viability. The medium typically contains cryoprotective agents that help minimize ice crystal formation, osmotic stress, and other factors that can compromise cellular integrity. By using organoid cryopreservation medium, researchers and medical professionals can store organoids for extended periods, allowing for long-term studies, experimentation, and future use in transplantation or regenerative medicine applications.
