Abstracts

The global Organoid Cryopreservation Medium market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Organoid cryopreservation medium refers to a specialized solution used in the preservation of organoids, which are three-dimensional structures that mimic the architecture and function of organs. Cryopreservation is a process that involves freezing biological samples to extremely low temperatures to halt metabolic activity and preserve cellular structures. Organoids, often derived from stem cells, are used in research and medical applications. The cryopreservation medium is formulated to protect organoids during freezing and thawing processes, preventing damage to cells and preserving their viability. The medium typically contains cryoprotective agents that help minimize ice crystal formation, osmotic stress, and other factors that can compromise cellular integrity. By using organoid cryopreservation medium, researchers and medical professionals can store organoids for extended periods, allowing for long-term studies, experimentation, and future use in transplantation or regenerative medicine applications.
