## Abstracts

The global Organophilic Clay market size is expected to reach \$ 2116 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032). Organophilic clay is a chemically modified clay, typically based on bentonite, in which inorganic exchangeable cations are replaced by organic ammonium compounds, making the clay compatible with organic solvents and non-aqueous systems. These materials are widely used as rheological additives, thixotropic agents, and suspension stabilizers in coatings, inks, oilfield drilling fluids, lubricating greases, adhesives, sealants, and personal care formulations. In 2025, the average selling price of organophilic clay is approximately US\$3,200 per metric ton, with global sales volume of around 420,000 metric tons. The industry maintains a gross margin of 30%-50%, supported by formulation know-how, surface modification technology, consistency requirements, and application-specific customization. Downstream demand is driven by industrial formulation manufacturers seeking viscosity control, stability enhancement, and performance reliability in non-aqueous systems.

Industry analysis indicates that organophilic clay demand is shifting toward higher-purity, low-dust, and application-tailored grades, particularly in coatings, oilfield chemicals, and specialty lubricants. Competitive advantage increasingly depends on dispersion performance, consistency across batches, and technical service support rather than volume scale alone.

This report studies the global Organophilic Clay production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Organophilic Clay and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year. This report explores demand trends and competition, as well as details the characteristics of Organophilic Clay that contribute to its increasing demand across many markets.
