Orthopedic braces are medical devices designed to address musculoskeletal issues; they are used to properly align, correct the position, support, stabilize, and protect certain parts of the body (particularly the muscles, joints, and bones) as they heal from injury or trauma. These medical devices are often prescribed for the patient to wear during the process of recovery and rehabilitation. An orthopedic cast, or simply cast, is a shell, frequently made from plaster or fiberglass, encasing a limb (or, in some cases, large portions of the body) to stabilize and hold anatomical structures, most often a broken bone (or bones), in place until healing is confirmed. It is similar in function to a splint. A splint is a device used for support or immobilization of a limb or the spine. It can be used in multiple situations, including temporary immobilization of potentially broken bones or damaged joints and support for joints during activity.
