Orthopedic forged prostheses are advanced medical devices designed to replace or support damaged bones and joints in the musculoskeletal system. These prostheses are typically made through a forging process, which involves shaping metal under high pressure to enhance its strength and durability. This manufacturing technique allows for a more precise fit and improved biomechanical performance compared to traditionally cast prosthetic components. Orthopedic forged prostheses are commonly used in joint replacements, such as hip or knee surgeries, as well as in trauma cases to stabilize fractures. Their design focuses on mimicking the natural movement of the body, promoting better patient outcomes and overall functionality.
