The osmotic pump type sustained-release preparation is an oral solid preparation that controls the drug release rate through the osmotic pressure principle. It is mainly composed of a tablet core, a coating membrane, and a drug release hole. After oral administration, water in the body enters the preparation through a semipermeable membrane, dissolves the drug and osmotically active substances, and uses the osmotic pressure difference inside and outside the preparation to pump the drug out at a constant rate. This design allows the drug to be released at a constant rate, which has significant advantages in reducing the number of dosing times, stabilizing blood drug concentrations, and improving patient compliance.
