## Abstracts

According to our (Global Info Research) latest study, the global OT Secure Remote Access Software market size was valued at US\$ 781 million in 2025 and is forecast to a readjusted size of US\$ 1171 million by 2032 with a CAGR of 6.0% during review period.

Operational technology (OT) secure remote access software is used to secure remote connections between operators and OT environments. Typically, these consist of industrial equipment and machinery that present physical and digital risks if compromised. Companies use OT secure remote access software to manage users, allocate access privileges, and monitor behaviors for anomalies, threats, or misuse. These tools are traditionally managed by IT and security teams who specialize in complex industrial environments. Increasingly connected equipment and expanding remote workforces have increased the need for businesses to securely control access to their OT. These tools have similar features to many privileged access management (PAM) software and IoT security software. However, unlike OT secure remote access software, neither tool is designed to secure business-critical operational environments.

The OT Secure Remote Access Software (OT-SRPT, often referring to remote access solutions for industrial control systems) market is currently experiencing stable growth. The core drivers are the increasing security requirements for remote operation and maintenance, emergency repair, and field equipment management, as well as the continued emphasis on compliance, auditability, and least privilege access. Market focus is on strong authentication, fine-grained device-level access control, zero-trust-based segmentation and session monitoring, and optimized support for bandwidth, latency, and offline scenarios. The competitive landscape features a coexistence of traditional industrial control system vendors, security vendors, and startups. User

demands are concentrated on improving availability, reducing false alarms, achieving end-to-end traceability and compliance, while also requiring minimally invasive security hardening and improved operational efficiency for existing OT networks.
