## Abstracts

According to our (Global Info Research) latest study, the global OTA Shielding Room market size was valued at US\$ 3042 million in 2025 and is forecast to a readjusted size of US\$ 4002 million by 2032 with a CAGR of 4.0% during review period.

An OTA Shielding Room is an integrated test setup used to evaluate a wireless device's radiated transmit/receive performance through the air (without a conducted RF cable), typically combining an anechoic or reverberation chamber, device positioning/rotation, calibrated antennas/probes, RF instrumentation and a radio communications tester, plus automation software to run standardized procedures and generate reports. It is commonly used to measure metrics such as Total Radiated Power (TRP), Total Isotropic Sensitivity (TIS)/Total Radiated Sensitivity (TRS), radiation patterns, and MIMO-related performance for devices with embedded antennas (phones, IoT, automotive, etc.) under frameworks referenced by CTIA and 3GPP.

OTA Shielding Room prices mainly depend on how big the chamber is and how complex the test method is: small benchtop or compact OTA boxes are usually tens of thousands of dollars, small shielded chambers for basic OTA/throughput work are often tens to low hundreds of thousands, mmWave ?plane-wave? chambers like CATR for handset-level 5G testing are typically a few hundred thousand to under about a million, more advanced systems like multi-probe near-field (MPAC) or reverberation setups commonly run from the high hundreds of thousands into the millions, and the largest setups?automotive radar or full-vehicle OTA chambers?are usually multi-million dollars.

Upstream, an OTA Shielding Room is built by combining a controlled test environment (anechoic or reverberation chamber), antennas/probes, positioners, RF

cables/switching, and measurement instruments (signal generator/analyzer or radio tester), plus software and calibration services to make the results accurate and repeatable. Downstream, it's used by device makers and test labs to check how wireless products perform through the air, such as phone/IoT connectivity, 5G beamforming, throughput, and radiated power/sensitivity.

From a market perspective, OTA Shielding Rooms are shifting from a specialized lab asset into a core enabler of wireless product release cycles because antennas are increasingly embedded, beamforming and MIMO performance must be verified over the air, and certification and operator-acceptance expectations continue to evolve for both FR1 and FR2 device classes. Demand is being pulled not only by mobile and IoT device makers and accredited test labs, but also by automotive programs as radar and vehicle connectivity workloads expand and require repeatable chamber-based validation. Commercial competition is therefore moving toward turnkey, automation-heavy solutions that reduce correlation risk and shorten time-to-answer across CATR plane-wave testing, multi-probe near-field methods, and reverberation approaches, while the main headwinds remain high facility complexity, calibration and validation burden, and the need to keep pace with evolving test methods as 3GPP advances its roadmap toward future generations.
