## Abstracts

The global OTA Testing Service market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

OTA stands for Over-the-Air Test System. It is a method for evaluating the performance and functionality of wireless devices such as smartphones, tablets, and IoT devices in real-world wireless environments. Traditional testing methods involve using cables to connect devices to test equipment, which may not accurately represent how a device will perform on a wireless network. In contrast, OTA testing allows for a more realistic assessment by simulating real scenarios and conditions. OTA testing services use anechoic or reverberant chambers to create simulated wireless environments. The device under test (DUT) is placed in the test chamber and various tests are performed to measure parameters such as signal strength, call quality, data throughput, antenna performance and power consumption. By using OTA testing services, manufacturers can evaluate the wireless performance, reliability of their devices, identify any potential issues, and make improvements before the devices are released to the market. This ensures that the equipment meets the required standards and provides optimum performance to the end user.
