Abstracts

The global Otoacoustic Emission Testing Machines market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Otoacoustic emissions record audio energy generated in the cochlea, conducted through the ossicular chain and tympanic membrane, and then released into the external auditory canal. For general newborn screening, otoacoustic emissions are recorded within 3 days and 72 hours. If the otoacoustic emission fails, to a certain extent, it may be due to dysfunction of the outer hair cells of the cochlea, resulting in so-called 'cochlear hearing loss.'

This report studies the global Otoacoustic Emission Testing Machines production, demand, key manufacturers, and key regions.
