## Abstracts

According to our (Global Info Research) latest study, the global Otologic Surgical Robot market size was valued at US\$ 123 million in 2025 and is forecast to a readjusted size of US\$ 223 million by 2032 with a CAGR of 8.8% during review period.

Otologic surgical robot is an intelligent medical device specifically designed for minimally invasive ear surgeries, primarily used in delicate procedures such as cochlear implantation and middle ear surgery. Their core function is to overcome the physiological limitations of the human hand, achieving uniform, tremor-free electrode implantation through high-precision robotic control. Implantation speeds can be as low as 0.1 mm/s, significantly superior to human hand operation. It solves three core problems: first, eliminating the risk of damage to the delicate structures of the inner ear caused by unavoidable physiological tremors; second, precisely planning the surgical path through preoperative 3D reconstruction to effectively avoid critical structures such as the facial nerve; and third, standardizing and homogenizing surgical procedures, reducing differences in efficacy due to variations in surgeon skill. Upstream, it involves the research and manufacturing of core components such as high-precision servo motors, reducers, force sensors, optical navigation systems, high-temperature drills, and surgical planning software; downstream, it serves medical institutions at all levels, including ENT departments of tertiary hospitals, specialized surgical centers, and ear research institutes, with applications covering minimally invasive ear diagnosis and treatment fields such as cochlear implantation, ossicular chain reconstruction, and endoscopic ear surgery. In 2025, the production of otologic surgery robots will be approximately 80 units, with an average price of approximately US\$1.5 million per unit, a gross profit margin of approximately 55%, and a single production line capacity of 10 units per year.
