Abstracts

Electroceramics are advanced ceramic materials that exhibit electronic, optical or electro-magnetic properties. Electroceramic materials are used for specific technological applications, which include the manufacture of data storage devices, sensors, transducers, and actuators. Electroceramic materials can be divided into multiple subclasses, with each subclass being used for specific applications. Major materials for electroceramics include titanate, zirconia, alumina, and others. Titanate is a base material in piezoelectric ceramics, while alumina is used to develop metrology components, actuators, semiconductor cores, and substrates. Semiconducting oxides are used for environment monitoring, in magnetic ceramic materials, which are used for data storage, and ferroelectric materials, which are used to develop accelerometers. Due to their increase in their demand, the consumption of electroceramics is expected to increase in the near future.
