According to our (Global Info Research) latest study, the global Over-the-Air (OTA) Chamber market size was valued at US\$ 3037 million in 2024 and is forecast to a readjusted size of USD 5690 million by 2031 with a CAGR of 9.5% during review period.

As MIMO radios become more popular, OTA testing is critical to determining the impact of multipath on radio frequency (RF) performance. Since the antenna is the basis of the integration concept, RF performance testing must take the antenna into account. This requires OTA measurements and RF propagation model simulations. Most industry players are focused on optimizing their designs to understand and evaluate key attributes such as antenna pattern, directivity, and gain. As a result, they are increasingly adopting OTA technology to determine the radio frequencies produced by antennas in the air.

The increase in the number of autonomous vehicles is also likely to drive rapid growth in the use of OTA testing, as most original equipment manufacturers (OEMs) focus on integrating OTA capabilities into autonomous vehicles. This is expected to contribute significantly to market revenue growth. However, the complexity associated with antenna arrays and deployment and high cost of test equipment are expected to restrain the growth of the wireless test market to some extent during the forecast period.
