Abstracts

Turbocharger is a type of forced induction system. Turbocharger uses the exhaust flow from the engine to spin a turbine, which in turn spins an air pump, compressing the air flowing into the engine. Turbocharger lets the engine squeeze more air into a cylinder and more air means more fuel can be added. So the engine can produce more power without increasing the engine emissions. The turbocharger has four main components, the turbine, the compressor, the control system and the bearing system.

According to our (Global Info Research) latest study, the global Overall Turbochargers market size was valued at US\$ 22390 million in 2023 and is forecast to a readjusted size of USD 45390 million by 2030 with a CAGR of 10.7% during review period.
