Abstracts

The global Ovine and Caprine Artificial Insemination market size is expected to reach \$ 1638 million by 2029, rising at a market growth of 6.0% CAGR during the forecast period (2023-2029).

In developing countries, AI activities have gained greater attention in serving as a successful tool for genetic improvement in ovine & caprine species. An article published by the National Library of Medicine in 2019 states that over 500,000 sheep in Australia, more than 60,000 sheep in Spain, about 50,000 sheep in Canada, and over 300,000 sheep in America have been successfully inseminated each year. The number of inseminated animals is significantly growing in small-scale production units owing to the rising awareness among breeders of AI services.

The growing number of government-approved semen collection centers for domestic animals like ovine & caprine is boosting the growth of the segment. For instance, on 16th March 2023, the UK government updated its list from five to six authorized ovine & caprine semen collection centers available in the country.

Artificial insemination (AI) is one of the most important techniques that improve the genetics of livestock animals. After cattle and swine, ovine & caprine production units are rapidly adopting artificial insemination procedures to reduce the reliance on bought-in male sheep and prevent the potency of disease transmission. The success of AI procedures in ovine & caprine relies on the ability to efficiently collect & cryopreserve/freezing seminal fluid from quality male animals, the appropriate procedure & timing of insemination in ewe and doe (female animals), and the seasonality of animal production.
