Oxide Solid Electrolyte Powder is an inorganic lithium-ion conducting powder used in solid-state batteries and hybrid solid-liquid battery systems. It includes garnet-type, NASICON-type, perovskite-type and other oxide electrolyte materials designed to provide high ionic conductivity, thermal stability, electrochemical stability and improved battery safety. The product is used in solid-state battery separators, composite cathodes, interfacial layers and electrolyte membranes. The market includes battery-grade oxide solid electrolyte powders, but excludes sulfide electrolytes, polymer electrolytes, ordinary ceramic powders and finished battery cells.

The industry chain includes lithium salts, lanthanum compounds, zirconium compounds, titanium compounds, phosphate materials, dopants, solvents, milling media, calcination equipment and powder processing systems. Midstream production covers raw material mixing, solid-state reaction, calcination, milling, classification, surface modification, moisture control, ionic conductivity testing and packaging. Downstream demand comes

from solid-state battery developers, battery material companies, research lines, pilot production, EV batteries and energy storage batteries. Growth is driven by battery safety, solid-state battery commercialization, lithium metal anodes and high-energy-density battery development.
